

# **Sitronix**

ST7032

# Dot Matrix LCD Controller/Driver

# n Features

- I 5 x 8 dot matrix possible
- I Low power operation support:
  - -- 2.7 to 5.5V
- I Range of LCD driver power
  - -- 3.0 to 7.0V
- I 4-bit, 8-bit, serial MPU or 400kbits/s fast I<sup>2</sup>C-bus interface are available
- I 80 x 8-bit display RAM (80 characters max.)
- I 10,240-bit character generator ROM for a total of 256 character fonts(max)
- I 64 x 8-bit character generator RAM(max)
- I 16-common x 80-segment and 1-common x 80-segment ICON liquid crystal display driver
- I 16 x 5 -bit ICON RAM(max)

- Wide range of instruction functions: Display clear, cursor home, display on/off, cursor on/off, display character blink, cursor shift, display shift, double height font
- I Automatic reset circuit that initializes the controller/driver after power on and external reset pin
- I Internal oscillator(Frequency=540KHz) and external clock
- I Built-in voltage booster and follower circuit (low power consumption)
- I Com/Seg direction selectable
- I Multi-selectable for CGRAM/CGROM size
- I Instruction compatible to ST7066U and KS0066U and HD44780
- I Available in COG type

# n Description

The ST7032 dot-matrix liquid crystal display controller can display alphanumeric, Japanese kana characters, and symbols. It can be configured to drive a dot-matrix liquid crystal display under the control of a 4 / 8-bit with 6800-series or 8080-series, 3/4-line serial interface microprocessor. Since all the functions such as display RAM, character generator ROM/RAM and liquid crystal driver, required for driving a dot-matrix liquid crystal display are internally provided on one chip, a minimal system can be used with this controller/driver.

The ST7032 character generator ROM size is 256 5x8dot bits which can be used to generate 256 different character fonts (5x8dot).

The ST7032 is suitable for low voltage supply (2.7V to 5.5V) and is perfectly suitable for any portable product which is driven by the battery and requires low power consumption.

The ST7032 LCD driver consists of 17 common signal drivers and 80 segment signal drivers. The maximum display RAM size can be either 80 characters in 1-line display or 40 characters in 2-line display. A single ST7032 can display up to one 16-character line or two 16-character lines.

The ST7032 dot-matrix LCD driver does not need extra cascaded drivers.

# n Product Number

ST7032 supports various function for customer. Please specify correct product number for application: For example, "<u>ST7032–0D</u>" the first part is illustrated below and the second part is the identification code of the built-in character generation ROM. Please refer to the appendix for the character generation ROM code information.

ST7032	6800-4bit / 8bit, 4-Line interface (without IIC interface)	J
ST7032i	IIC interface	BUS

# n Function Description

#### I System Interface

This chip has all four kinds of interface type with MPU: 4-bit bus, 8-bit bus, serial and fast I<sup>2</sup>C interface. 4-bit bus or 8-bit bus is selected by DL bit in the instruction register.

During read or write operation, two 8-bit registers are used. One is data register (DR); the other is instruction register (IR).

The data register (DR) is used as temporary data storage place for being written into or read from DDRAM/CGRAM/ICON RAM, target RAM is selected by RAM address setting instruction. Each internal operation, reading from or writing into RAM, is done automatically. So to speak, after MPU reads DR data, the data in the next DDRAM/CGRAM/ICON RAM address is transferred into DR automatically. Also after MPU writes data to DR, the data in DR is transferred into DDRAM/CGRAM/ICON RAM automatically.

The Instruction register (IR) is used only to store instruction code transferred from MPU. MPU cannot use it to read instruction data.

Using RS input pin to select command or data in 4-bit/8-bit bus mode.

RS	R/W	Operation
L	т	Instruction Write operation (MPU writes Instruction code
ш	ц	into IR)
L	Н	Read Busy Flag(DB7) and address counter (DB0 ~ DB6)
Н	L	Data Write operation (MPU writes data into DR)
Н	Н	Data Read operation (MPU reads data from DR)

Table 1. Various kinds of operations according to RS and R/W bits.

### I<sup>2</sup>C interface

It just only could write Data or Instruction to ST7032 by the IIC Interface. It could not read Data or Instruction from ST7032 (except Acknowledge signal).

SCL: serial clock input SDA: serial data input

Slaver address could only set to 0111110, no other slaver address could be set

The  $I^2C$  interface send RAM data and executes the commands sent via the  $I^2C$  Interface. It could send data bit to the RAM. The  $I^2C$  Interface is two-line communication between different ICs or modules. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

#### **BIT TRANSFER**

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse because changes in the data line at this time will be interpreted as a control signal. Bit transfer is illustrated in Fig.1.

#### **START AND STOP CONDITIONS**

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P). The START and STOP conditions are illustrated in Fig.2.

#### **SYSTEM CONFIGURATION**

The system configuration is illustrated in Fig.3.

- · Transmitter: the device, which sends the data to the bus
- · Master: the device, which initiates a transfer, generates clock signals and terminates a transfer
- · Slave: the device addressed by a master

- · Multi-Master: more than one master can attempt to control the bus at the same time without corrupting the message
- · Arbitration: procedure to ensure that, if more than one master simultaneously tries to control the bus, only one is allowed to do so and the message is not corrupted
- · Synchronization: procedure to synchronize the clock signals of two or more devices.

#### **ACKNOWLEDGE**

#### Acknowledge is not Busy Flag in I2C interface.

Each byte of eight bits is followed by an acknowledge bit. The acknowledge bit is a HIGH signal put on the bus by the transmitter during which time the master generates an extra acknowledge related clock pulse. A slave receiver which is addressed must generate an acknowledge after the reception of each byte. A master receiver must also generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be taken into consideration). A master receiver must signal an end-of-data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a STOP condition. Acknowledgement on the I<sup>2</sup>C Interface is illustrated in Fig.4.

#### I<sup>2</sup>C Interface protocol

The ST7032 supports command, data write addressed slaves on the bus.

Before any data is transmitted on the I<sup>2</sup>C Interface, the device, which should respond, is addressed first. Only one 7-bit slave addresses (011111**10**) is reserved for the ST7032. The R/W is assigned to 0 for Write only. The I<sup>2</sup>C Interface protocol is illustrated in Fig.5.

The sequence is initiated with a START condition (S) from the  $I^2C$  Interface master, which is followed by the slave address. All slaves with the corresponding address acknowledge in parallel, all the others will ignore the  $I^2C$  Interface transfer. After acknowledgement, one or more command words follow which define the status of the addressed slaves.

A command word consists of a control byte, which defines Co and RS, plus a data byte.

The last control byte is tagged with a cleared most significant bit (i.e. the continuation bit Co). After a control byte with a cleared Co bit, only data bytes will follow. The state of the RS bit defines whether the data byte is interpreted as a command or as RAM data. All addressed slaves on the bus also acknowledge the control and data bytes. After the last control byte, depending on the RS bit setting; either a series of display data bytes or command data bytes may follow. If the RS bit is set to logic 1, these display bytes are stored in the display RAM at the address specified by the data pointer. The data pointer is automatically updated and the data is directed to the intended ST7032i device. If the RS bit of the last control byte is set to logic 0, these command bytes will be decoded and the setting of the device will be changed according to the received commands. Only the addressed slave makes the acknowledgement after each byte. At the end of the transmission the I<sup>2</sup>C INTERFACE-bus master issues a STOP condition (P).

During write operation, two 8-bit registers are used. One is data register (DR), the other is instruction register (IR).

The data register (DR) is used as temporary data storage place for being written into DDRAM/CGRAM/ICON RAM, target RAM is selected by RAM address setting instruction. Each internal operation, writing into RAM, is done automatically. So to speak, after MPU writes data to DR, the data in DR is transferred into DDRAM/CGRAM/ICON RAM automatically.

The Instruction register (IR) is used only to store instruction code transferred from MPU. MPU cannot use it to read instruction data.

To select register, use RS input in I<sup>2</sup>C interface.

RS	R/W	Operation
L		Instruction Write operation (MPU writes Instruction code into IR)
Н	L	Data Write operation (MPU writes data into DR)

Table 2. Various kinds of operations according to RS and R/W bits.

#### I Busy Flag (BF)

When BF = "High", it indicates that the internal operation is being processed. So during this time the next instruction cannot be accepted. BF can be read, when RS = Low and R/W = High (Read Instruction Operation), through DB7 port. Before executing the next instruction, be sure that BF is not High.

#### I Address Counter (AC)

Address Counter (AC) stores DDRAM/CGRAM/ICON RAM address, transferred from IR.

After writing into (reading from) DDRAM/CGRAM/ICON RAM, AC is automatically increased (decreased) by 1.

When RS = "Low" and R/W = "High", AC can be read through DB0 ~ DB6 ports.

#### I Display Data RAM (DDRAM)

Display data RAM (DDRAM) stores display data represented in 8-bit character codes. Its extended capacity is 80 x 8 bits, or 80 characters. The area in display data RAM (DDRAM) that is not used for display can be used as general data RAM. See Figure 7 for the relationships between DDRAM addresses and positions on the liquid crystal display.

The DDRAM address (ADD) is set in the address counter (AC)as hexadecimal.

# Ø 1-line display (N = 0) (Figure 8)

When there are fewer than 80 display characters, the display begins at the head position. For example, if using only the ST7032, 16 characters are displayed. See Figure 8.

When the display shift operation is performed, the DDRAM address shifts. See Figure 9.

Figure 7. DDRAM Address

Figure 8. 1-Line Display

Figure 9. 1-Line by 16-Character Display Example

# Ø 2-line display (N = 1) (Figure 10)

Case 1: When the number of display characters is less than 40  $_{\cdot}$  2 lines, the two lines are displayed from the head. Note that the first line end address and the second line start address are not consecutive. See Figure 10.

Figure 10. 2-Line Display

Case 2: For a 16-character \_ 2-line display See Figure 11. When display shift operation is performed, the DDRAM address shifts. See Figure 11.

Display Position	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

For Shift	27	00	01	02	03	04	05	06	07	80	09	0A	0B	0C	0D	0E
Right	67	40	41	42	43	44	45	46	47	48	49	4A	4B	4C	4D	4E

Figure 11. 2-Line by 16-Character Display Example

#### I Character Generator ROM (CGROM)

The character generator ROM generates 5 x 8 dot character patterns from 8-bit character codes. It can generate 240/250/248/256 5 x 8 dot character patterns (select by OPR1/2 ITO pin). User-defined character patterns are also available by mask-programmed ROM.

#### I Character Generator RAM (CGRAM)

In the character generator RAM, the user can rewrite character patterns by program. For 5 x 8 dots, eight character patterns can be written.

Write into DDRAM the character codes at the addresses shown as the left column of code table (refer to appendix) to show the character patterns stored in CGRAM.

See Table 4 for the relationship between CGRAM addresses and data and display patterns. Areas that are not used for display can be used as general data RAM.

#### I ICON RAM

In the ICON RAM, the user can rewrite icon pattern by program.

There are totally 80 dots for icon can be written.

See Table 5 for the relationship between ICON RAM address and data and the display patterns.

#### I Timing Generation Circuit

The timing generation circuit generates timing signals for the operation of internal circuits such as DDRAM, CGROM and CGRAM. RAM read timing for display and internal operation timing by MPU access are generated separately to avoid interfering with each other. Therefore, when writing data to DDRAM, for example, there will be no undesirable interference, such as flickering, in areas other than the display area.(In I<sup>2</sup>C interface the reading function is invalid.)

#### I LCD Driver Circuit

LCD Driver circuit has 17 common and 80 segment signals for LCD driving. Data from CGRAM/CGROM/ICON is transferred to 80 bit segment latch serially, and then it is stored to 80 bit shift latch. When each common is selected by 17 bit common register, segment data also output through segment driver from 80 bit segment latch.

#### I Cursor/Blink Control Circuit

It can generate the cursor or blink in the cursor/blink control circuit. The cursor or the blink appears in the digit at the display data RAM address set in the address counter.

			0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0							_	RAN res				_	ara CG				_	;

Table 4. Relationship between CGRAM Addresses, Character Codes (DDRAM) and Character patterns (CGRAM Data)

#### Notes:

- 1. Character code bits 0 to 2 correspond to CGRAM address bits 3 to 5 (3 bits: 8 types).
- 2. CGRAM address bits 0 to 2 designate the character pattern line position. The 8th line is the cursor position and its display is formed by a logical OR with the cursor. Maintain the 8th line data, corresponding to the cursor display position, at 0 as the cursor display. If the 8th line data is 1, 1 bit will light up the 8th line regardless of the cursor presence.
- 3. Character pattern row positions correspond to CGRAM data bits 0 to 4 (bit 4 being at the left).
- 4. As shown Table 4, CGRAM character patterns are selected when character code bits 4 to 7 are all 0. However, since character code bit 3 has no effect, the R display example above can be selected by either character code 00H or 08H.
- 5. "1" for CGRAM data corresponds to display selection and "0" to non-selection, "-" Indicates no effect.
- 6. Different OPR1/2 ITO option can select different CGRAM size.

Write data to RAM	1	0	D7	D6	D5	D4	D3	D2	D1	D0	Write data into internal RAM (DDRAM/CGRAM)	26.3 us 18.5 us		14.3 us
Read data from RAM	1	1	D7	D6	D5	D4	D3	D2	D1	D0	Read data from internal RAM (DDRAM/CGRAM)	26.3 us	18.5 us	14.3 us

#### Note:

Be sure the ST7032 is not in the busy state (BF = 0) before sending an instruction from the MPU to the ST7032. If an instruction is sent without checking the busy flag, the time between the first instruction and next instruction will take much longer than the instruction time itself. Refer to Instruction Table for the list of each instruction execution time.

# Ø instruction table at "Extension mode"

(when "EXT" option pin connect to VSS, the instruction set follow below table)

Instruction		•	Ir	nstr	ucti	on	Coc	le			Description		nstruction cution T	
Instruction	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description	OSC= 380KHz	OSC= 540kHz	OSC= 700KHz

# n Instruction Description

# I Clear Display

R	S	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
(	)	0	0	0	0	0	0	0	0	1

Clear all the display data by writing "20H" (space code) to all DDRAM address, and set DDRAM address to "00H" into AC (address counter). Return cursor to the original status, namely, bring the cursor to the left edge on first line of the display. Make entry mode increment (I/D = "1").

#### I Return Home

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	Х

Return Home is cursor return home instruction. Set DDRAM address to "00H" into the address counter. Return cursor to its original site and return display to its original status, if shifted. Contents of DDRAM do not change.

### I Entry Mode Set

RS	R/W	 DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	S

Set the moving direction of cursor and display.

# Ø I/D: Increment / decrement of DDRAM address (cursor or blink)

When I/D = "High", cursor/blink moves to right and DDRAM address is increased by 1.

When I/D = "Low", cursor/blink moves to left and DDRAM address is decreased by 1.

#### Ø S: Shift of entire display

When DDRAM read (CGRAM read/write) operation or S = "Low", shift of entire display is not performed. If S = "High" and DDRAM write operation, shift of entire display is performed according to I/D value (I/D = "1": shift left, I/D = "0": shift right).

S	I/D	Description
Н	Н	Shift the display to the left
Н	L	Shift the display to the right

<sup>\*</sup> CGRAM operates the same as DDRAM, when read from or write to CGRAM.

# I Display ON/OFF

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	С	В

Control display/cursor/blink ON/OFF 1 bit register.

# Ø D: Display ON/OFF control bit

When D = "High", entire display is turned on.

When D = "Low", display is turned off, but display data is remained in DDRAM.

#### Ø C: Cursor ON/OFF control bit

When C = "High", cursor is turned on.

When C = "Low", cursor is disappeared in current display, but I/D register remains its data.

# Ø B: Cursor Blink ON/OFF control bit

When B = "High", cursor blink is on, that performs alternate between all the high data and display character at the cursor position.

When B = "Low", blink is off.

#### I Cursor or Display Shift

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	Х	X

#### Ø S/C: Screen/Cursor select bit

When S/C="High", Screen is controlled by R/L bit.

When S/C="Low", Cursor is controlled by R/L bit.

### Ø R/L: Right/Left

When R/L="High", set direction to right.

When R/L="Low", set direction to left.

Without writing or reading of display data, shift right/left cursor position or display. This instruction is used to correct or search display data. During 2-line mode display, cursor moves to the 2nd line after 40th digit of 1st line. Note that display shift is performed simultaneously in all the line. When displayed data is shifted repeatedly, each line shifted individually. When display shift is performed, the contents of address counter are not changed.

S/C	R/L	Description	AC Value
L	L	Shift cursor to the left	AC=AC-1
L	Н	Shift cursor to the right	AC=AC+1
Н	L	Shift display to the left. Cursor follows the display shift	AC=AC
Н	Н	Shift display to the right. Cursor follows the display shift	AC=AC

#### I Function Set

RS	R/W	_	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0		0	0	1	DL	N	DH	0	IS

### Ø DL: Interface data length control bit

When DL = "High", it means 8-bit bus mode with MPU.

When DL = "Low", it means 4-bit bus mode with MPU. So to speak, DL is a signal to select 8-bit or 4-bit bus mode.

When in 4-bit bus mode, it needs to transfer 4-bit data by two times.

#### Ø N: Display line number control bit

When N = "High", 2-line display mode is set.

When N = "Low", it means 1-line display mode.

# Ø DH: Double height font type control bit

When DH = "High" and N= "Low", display font is selected to double height mode (5x16 dot), RAM address can only use 00H-27H.

When DH= "High" and N= "High", it is forbidden.

When DH = " Low ", display font is normal (5x8 dot).

N	DH	EXT option pin c	onnect to high	EXT option pin connect to low			
IN	Display Lines		<b>Character Font</b>	Display Lines	<b>Character Font</b>		
L	L	1	5x8	1	5x8		
L	I	1	5x8	1	5x16		
Н	L	2	5x8	2	5x8		
Н	I	2	5x8	Forb	idden		

#### 2 line mode normal display (DH=0/N=1)

### 1 line mode with double height font (DH=1/N=0)

#### Ø IS: normal/extension instruction select

When IS=" High", extension instruction be selected (refer extension instruction table)

When IS=" Low", normal instruction be selected (refer normal instruction table)

#### I Set CGRAM Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU.

#### I Set DDRAM Address

RS	R/W	_	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0		1	AC6	AC5	AC4	AC3	AC2	AC1	AC0

Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

When 1-line display mode (N = 0), DDRAM address is from "00H" to "4FH".

In 2-line display mode (N = 1), DDRAM address in the 1st line is from "00H" to "27H", and DDRAM address in the 2nd line is from "40H" to "67H".

# I Read Busy Flag and Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0

When BF = "High", indicates that the internal operation is being processed. So during this time the next instruction cannot be accepted.

The address Counter (AC) stores DDRAM/CGRAM addresses, transferred from IR.

After writing into (reading from) DDRAM/CGRAM, AC is automatically increased (decreased) by 1.

# I Write Data to CGRAM, DDRAM or ICON RAM

Write binary 8-bit data to CGRAM, DDRAM or ICON RAM

The selection of RAM from DDRAM, CGRAM or ICON RAM, is set by the previous address set instruction : DDRAM address set, CGRAM address set, ICON RAM address set. RAM set instruction can also determine the AC direction to RAM.

After write operation, the address is automatically increased/decreased by 1, according to the entry mode.

# I Read Data from CGRAM, DDRAM or ICON RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM/ICON RAM

The selection of RAM is set by the previous address set instruction. If address set instruction of RAM is not performed before this instruction, the data that read first is invalid, because the direction of AC is not determined. If you read RAM data several times without RAM address set instruction before read operation, you can get correct RAM data from the second, but the first data would be incorrect, because there is no time margin to transfer RAM data.

\*Read data must be "set address" before this instruction.

# I Bias selection/Internal OSC frequency adjust

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	BS	F2	F1	F0

#### Ø BS: bias selection

When BS="High", the bias will be 1/4

When BS="Low", the bias will be 1/5

BS will be invalid when external bias resistors are used (OPF1=1, OPF2=1)

# Ø F2,F1,F0: Internal OSC frequency adjust

When CLS connect to high, that instruction can adjust OSC and Frame frequency.

Interna	I frequency	/ adjust		quency ( Hz ) e mode)
F2	F1	F0	VDD = 3.0 V	VDD = 5.0 V
0	0	0	122	120
0	0	1	131	133
0	1	0	144	149
0	1	1	161	167
1	0	0	183	192
1	0	1	221	227
1	1	0	274	277
1	1	1	347	347

#### I Set ICON RAM address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	0	AC3	AC2	AC1	AC0

Set ICON RAM address to AC.

This instruction makes ICON data available from MPU.

When IS=1 at Extension mode,

The ICON RAM address is from "00H" to "0FH".

#### I Power/ICON control/Contrast set(high byte)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	1	Ion	Вом	C5	C4

#### Ø Ion: set ICON display on/off

When Ion = "High", ICON display on.

When Ion = "Low", ICON display off.

#### Ø Bon: switch booster circuit

Bon can only be set when internal follower is used (OPF1=0, OPF2=0).

When Bon = "High", booster circuit is turn on.

When Bon = "Low", booster circuit is turn off.

# Ø C5,C4 : Contrast set(high byte)

C5,C4,C3,C2,C1,C0 can only be set when internal follower is used (OPF1=0,OPF2=0). They can more precisely adjust the input reference voltage of V0 generator. The details please refer to the supply voltage for LCD driver.

#### I Follower control

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	1	0	Fon	Rab 2	Rab 1	Rab 0

#### Ø Fon: switch follower circuit

Fon can only be set when internal follower is used (OPF1=0,OPF2=0).

When Fon = "High", internal follower circuit is turn on.

When Fon = "Low", internal follower circuit is turn off.

# Ø Rab2,Rab1,Rab0: V0 generator amplified ratio

Rab2,Rab1,Rab0 can only be set when internal follower is used (OPF1=0,OPF2=0). They can adjust the amplified ratio of V0 generator. The details please refer to the supply voltage for LCD driver.

# I Contrast set(low byte)

RS	R/W	_	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0		0	1	1	1	СЗ	C2	C1	C0

# Ø C3,C2,C1,C0:Contrast set(low byte)

C5,C4,C3,C2,C1,C0 can only be set when internal follower is used (OPF1=0,OPF2=0). They can more precisely adjust the input reference voltage of V0 generator. The details please refer to the supply voltage for LCD driver.

# n Reset Function

# **Initializing by Internal Reset Circuit**

An internal reset circuit automatically initializes the ST7032 when the power is turned on. The following instructions are executed during the initialization. The busy flag (BF) is kept in the busy state (BF = 1) until the initialization ends. The busy state lasts for 40 ms after VDD rises to stable.

- 1. Display clear
- 2. Function set:

DL = 1; 8-bit interface data

N = 0; 1-line display

DH=0; normal 5x8 font

IS=0; use instruction table 0

- 3. Display on/off control:
  - D = 0; Display off
  - C = 0; Cursor off
  - B = 0; Blinking off
- 4. Entry mode set:
  - I/D = 1; Increment by 1
  - S = 0; No shift
- 5. Internal OSC frequency

(F2,F1,F0)=(1,0,0)

6. ICON control

Ion=0; ICON off

7. Power control

BS=0; 1/5bias

Bon=0; booster off

Fon=0; follower off

(C5,C4,C3,C2,C1,C0)=(1,0,0,0,0,0)

(Rab2,Rab1,Rab0)=(0,1,0)

#### Note:

If the electrical characteristics conditions listed under the table Power Supply Conditions Using Internal Reset Circuit are not met, the internal reset circuit will not operate normally and will fail to initialize the ST7032.

When internal Reset Circuit not operate, ST7032 can be reset by XRESET pin from MPU control signal.

# n Interfacing to the MPU

The ST7032 can send data in two 4-bit operations/one 8-bit operation, serial 1 bit operation or fast I<sup>2</sup>C operation, thus allowing interfacing with 4-bit, 8-bit or I<sup>2</sup>C MPU.

For 4-bit interface data, only four bus lines (DB4 to DB7) are used for transfer. Bus lines DB0 to DB3 are disabled. The data transfer between the ST7032 and the MPU is completed after the 4-bit data has been transferred twice. As for the order of data transfer, the four high order bits (for 8-bit operation, DB4 to DB7) are transferred before the four low order bits (for 8-bit operation, DB0 to DB3). The busy flag must be checked (one instruction) after the 4-bit data has been transferred twice. Two more 4-bit operations then transfer the busy flag and address counter data.

# Ø Example of busy flag check timing sequence

#### Ø Intel 8051 interface(4 Bit)

- I For 8-bit interface data, all eight bus lines (DB0 to DB7) are used.
- Ø Example of busy flag check timing sequence

# Ø Intel 8051 interface(8 Bit)

- I For serial interface data, only two bus lines (DB6 to DB7) are used.
- Ø Example of timing sequence

Note: The falling edge must cause on CSB before the serial clock ( SCL ) active.

### Ø Intel 8051 interface(Serial)

- I For I<sup>2</sup>C interface data, only two bus lines (DB6 to DB7) are used.
- Ø Example of timing sequence

### Ø Intel 8051 interface( I<sup>2</sup>C )

## n Supply Voltage for LCD Drive

When external bias resistors are used (OPF1=1,OPF2=1)

I When built-in bias resistors(9.6K $\Omega$ ) are used (OPF1=1,OPF2=0)

# I When built-in bias resistors(3.3K $\Omega$ ) are used (OPF1=0,OPF2=1)

I When built-in voltage followers with external Vout are used (OPF1=0,OPF2=0 and instruction setting Bon=0,Fon=1)

### I When built-in booster and voltage followers are used(OPF1=0,OPF2=0)

## Note: Ensure V0 level stable, that must let |Vout-V0| over 0.5V(if panel size over 4.5",the |Vout-V0| propose over 0.8V).

## ST7032

#### The recommanded curve: follower = 01H

#### Notes:

- 1. Vout  $\ge$  V0  $\ge$  V1  $\ge$  V2  $\ge$  V3  $\ge$  V4  $\ge$  Vss must be maintained.
- 2. If the calculation value of V0 is higher than Vout, the real V0 value will saturate to Vout.
- 3. internal built-in booster can only be used when OPF1=0,OPF2=0.

## n AC Characteristics

## n I/O Pad Configuration

Input PAD (No Pull-Up)

XRESET, E, RS, R/W, CSB, PSB, OPFx, OPRx, SHLx, CLS, EXT, PSI2B

### n LCD and ST7032 Connection

SHLC/SHLS ITO option pin can select at different direction for LCD panel

I Com normal direction/Seg normal direction

# ABCDEFGHIJKLMNOP QRSTUVWXYZABCDEF

2Line x 16 Characters, SHLC=1, SHLS=1

I Com normal direction/Seg reverse direction

I Com reverse direction/Seg normal direction

2Line x 16Characters, SHLC=0, SHLS=1

I Com reverse direction/Seg reverse direction

2Line x 16Characters, SHLC=0, SHLS=0

## n Application Circuit(ST7066U normal mode)

- Ø Use internal resistor(9.6K ohm) and contrast adjust with external VR.
- Ø Booster always off.
- Ø Has 240 character of CGROM and 8 characters of CGRAM
- Ø Internal oscillator.

## n Application Circuit(Extension mode)

- Ø Use internal follower circuit.
- Ø Booster has 2 times pump.
- Ø Has 240 character of CGROM and 8 characters of CGRAM
- Ø Internal oscillator

I When the heavy load is applied, the dotted line part could be added.

### n Application Circuit(for glass layout)

ST7032 over Glass,6800 serial 8bit interface, with booster and follower circuit on
